

WHAT IS FLUORIDE?

by a retired dentist.

FLUORIDE is a chemical element. It is toxic and long been known for its psychotropic ("nourishing the mind") effects. Fluoride has been introduced into the water supplies under the pretence that it prevents dental decay. This is a lie. Fluoride is a vital component in prescription drugs to act as "anti-anxiety and anti-psychotic agents". It is contained in Fluphenazine, Droperidol, Flupenthixol, Haloperidol, Pimozide, Disperidone, Tripfluoperazine, Paroxetine, Fluvamine and Fluoxetine. These are marketed under numerous proprietary names such as Prozac.

Fluoride in the water supply is Mass Medication - the effect of which is to make the People more compliant, more docile and less troublesome. This allows the Parliaments and Courts and to make and impose any laws they want to further their ambitions for Power and Wealth over and at the expense of the People. A dissident minority is easily dealt with when the majority are dumbed-out.

Fluoride displaces the hydroxide ion in the calcium apatite molecule which is the main component in tooth enamel. This makes it slightly more resistant to the action of acid to dissolve the calcium apatite because fluoride has a lower affinity to H⁺. This gives a temporary delay to the dissolution of the enamel but does not prevent it. It does not prevent the acid from decaying the dentine, which is the body of the tooth below the enamel surface, when it penetrates through fissural and other minute defects (including decomposed enamel) and, in the trade, we have the expression, "Fluoride Bombs", which describes the effect when the internal structure of the tooth (dentine) is so grossly decayed that, when the victim bites on his/her tooth, it implodes. This may or may not be prevented by "Fissure Sealing" with flowable composite (there are conflicting surveys on its effectiveness).

Fluoride is worse than a hoax....it is a serious hazard. Oral hygiene, diet and inherited immunity determine Dental Health.
